

ASTRONOMY - Find it here!

Astronomy is the scientific study of the universe and celestial bodies, especially their positions and movements.

What's an astronomer?

If you are interested in studying outer space and everything in it, you may want to be an **astronomer**. Astronomers study the solar system, galaxies, stars, comets, and the northern lights, just to name a few. Like any other scientists, astronomers use tools to help them, such as binoculars, telescopes and cameras.

One such telescope used by NASA is the Hubble telescope. The Hubble was launched into space in 1990 to capture pictures of space not visible from Earth. Astronomers have made great discoveries using this telescope. Take a look at some of these pictures that were taken from The Hubble - they are amazing!

If you find this exciting, consider a career in Astronomy!
